Int 21H, AH=42H

Version

2 and higher

Brief

“LSEEK” - SET CURRENT FILE POSITION

Family API

Input

```
AH = 42h
AL = origin of move
    00h start of file
    01h current file position
    02h end of file
BX = file handle
CX:DX = (signed) offset from origin of new file position
```

Return

CF clear if successful

```
DX:AX = new file position in bytes from start of file
CF set on error
AX = error code (01h,06h) (see #01680 at AH=59h/BX=0000h)
```

Notes

for origins 01h and 02h, the pointer may be positioned before the start of the file; no error is returned in that case (except under Windows NT), but subsequent attempts at I/O will produce errors

if the new position is beyond the current end of file, the file will be extended by the next write (see AH=40h); for FAT32 drives, the file must have been opened with AX=6C00h with the “extended size” flag in order to expand the file beyond 2GB

BUG: using this method to grow a file from zero bytes to a very large size can corrupt the FAT in some versions of DOS; the file should first be grown from zero to one byte and then to the desired large size
