

This is part of **Family API** which allow to create dual-os version of program runs under OS/2 and DOS

Note: This is legacy API call. It is recommended to use 32-bit equivalent

DosGetHugeShift

This call returns a shift count used to derive the selectors that address memory allocated with [DosAllocHuge](#).

Syntax

```
DosGetHugeShift (ShiftCount)
```

Parameters

- ShiftCount (PUSHORT) - output : Address of the shift count.

Return Code

rc (USHORT) - return

Return code description is:

- 0 NO_ERROR

Remarks

Each segment of a huge memory allocation has a unique selector. To compute the next sequential selector in a huge memory area, take the value 1, shift it left by the number of bits specified in shift count. Use the resulting value as an increment to add to the previous selector (using the selector returned by [DosAllocHuge](#) as the first selector). For example:

- Assume [DosAllocHuge](#) is issued with NumSeg equal to 3, and that the number 63 is returned for the selector of the first segment.
- If [DosGetHugeShift](#) returns a shift count of 4, shifting the value "1" by this amount results in an increment of 16.
- Adding this increment to selector number 63 produces 79 for the second selector. Adding the

same increment to selector number 79 yields 95 for the third selector.

Example Code

C Binding

```
#define INCL_DOSMEMMGR

USHORT rc = DosGetHugeShift(ShiftCount);

PUSHORT      ShiftCount;    /* Shift Count (returned) */

USHORT      rc;             /* return code */
```

MASM Binding

```
EXTRN DosGetHugeShift:FAR
INCL_DOSMEMMGR EQU 1

PUSH@ WORD ShiftCount ;Shift Count (returned)
CALL DosGetHugeShift

Returns WORD
```
