## DosQCurDisk

This call determines the current default drive for the requesting process.

### Syntax

```
DosQCurDisk (DriveNumber, LogicalDriveMap)
```

### Parameters

- DriveNumber ([PUSHORT](#)) - output : Address of the number of the default drive, for example:

Value	Definition'
1	A
2	B
.	.

- LogicalDriveMap ([PULONG](#)) - output : Address of the bit map (stored in the low-order portion of the 32-bit, doubleword area) where the system returns the mapping of the logical drives. Logical Drives A to Z have a one-to-one mapping with the bit positions 0 to 25 of the map; for example, bit 0 is drive A, bit 1 is drive B, and so forth. The settings of these bits indicate which drives exist:

Value	Definition
0	The logical drive does not exist.
1	The logical drive exists.

### Return Code

rc ([USHORT](#)) - return

Return code description is:

- 0 NO\_ERROR
